

Forex Frame

**Software-based trading system.
Fully focused on trading the EURO/USD.**

DEECKE FINANCIAL SOLUTIONS
Private Wealth Experts

TRADE LIKE A PRO

FULLY AUTOMATED AND WITH MAXIMUM TRANSPARENCY

Forex Frame is a specially developed, rule-based trading system that works continuously on your behalf in the EUR/USD currency pair. No gut feelings. No spontaneous decisions. No artificial intelligence. Just clear rules, transparent processes and a strategy that has been used successfully for years. The algorithm handles the entire process for you and trades automatically. Reliable, efficient and based on clearly defined strategies. Your capital remains in your own account and the trading model can be cancelled at any time. You will usually receive a refund of your capital within a few days.

WHAT IS FOREX FRAME?

A STRUCTURED TRADING SYSTEM!

The Forex Frame strategy utilises recurring price patterns, retracement zones and typical market overreactions to build capital in a structured manner. But always within clearly defined rules. By consistently specialising in just one currency pair, market movements can be analysed and traded with significantly greater precision than with broadly diversified multi-asset systems.

Forex Frame does not operate speculatively, but follows clearly identifiable patterns that occur particularly frequently in the euro/US dollar pair.

The aim is to make efficient use of market movements: without tying up capital unnecessarily, without overexposure, and with a strong focus on transparency, control and reproducible processes.

STRATEGY TYPE

REPRODUCIBLE AND FREE OF EMOTIONS

The strategy is based on an adaptive multi-entry structure with dynamic profit-target adjustment.

This means that new positions are only opened if defined technical and timing criteria are met. The decision on whether or not to open a position is made solely by the rule-based algorithm, not by the trader.

Instead of opening a single position, the strategy can build up exposure in a staggered and controlled manner, allowing market movements to be exploited more flexibly. With each additional position, the distance to the take-profit target shortens, as this is dynamically adjusted to the market situation.

ADVANTAGES

This methodology results in a structured trading approach that offers clear advantages over single-entry systems:

- Positions are opened only when parameters are met
- Dynamic adjustment of the take-profit level
- Reduced capital tied up per position
- Flexibility during trending and sideways phases

Reproducible set of rules – free from emotion

The algorithm does not use high-frequency trading, AI or news trading. During major economic events, it is paused manually and only reactivated once market conditions have stabilised. Open positions remain unchanged in the market.

CORE FUNCTIONS

AGILE AND SECURE PROCESS

ADAPTIVE MARKET ANALYSIS

The algorithm analyses the Euro-US Dollar market exclusively at fixed intervals – depending on the relevant timeframe. As a result, it does not react impulsively, but follows a structured set of rules. A position can only be opened if all technical parameters are met. In this way, the market is not ‘chased’, but assessed analytically..

STRUCTURED POSITION BUILDING

Instead of taking a single position, the strategy can build market exposure in several stages. Each new position is taken based on defined market conditions. This results in controlled position building.

DYNAMIC PROFIT TARGET ADJUSTMENT

With each additional position, the system recalculates the take-profit level. This shortens the path to profit realisation without having to alter the original market dynamics. Capital remains tied up for a shorter period and can be re-invested more quickly.

EMOTION-FREE TRADING PROCESS

The system makes decisions based solely on objective criteria. There are no subjective interventions, no spontaneous emotional trading activities. This ensures a trading approach that operates independently of human sentiment or decision-making pressure.

PREPARED FOR ALL EVENTUALITIES

TIMEFRAME-BASED RISK PROFILE

Risk is not managed through strict stop-loss mechanisms, but rather through the number of algorithms and the timeframes they use. For example, one algorithm checks the market just once an hour, whilst another does so twelve times an hour. This allows the trading frequency to be clearly scaled and the risk level to be flexibly adjusted.

CONTROLLED MARKET EXPOSURE

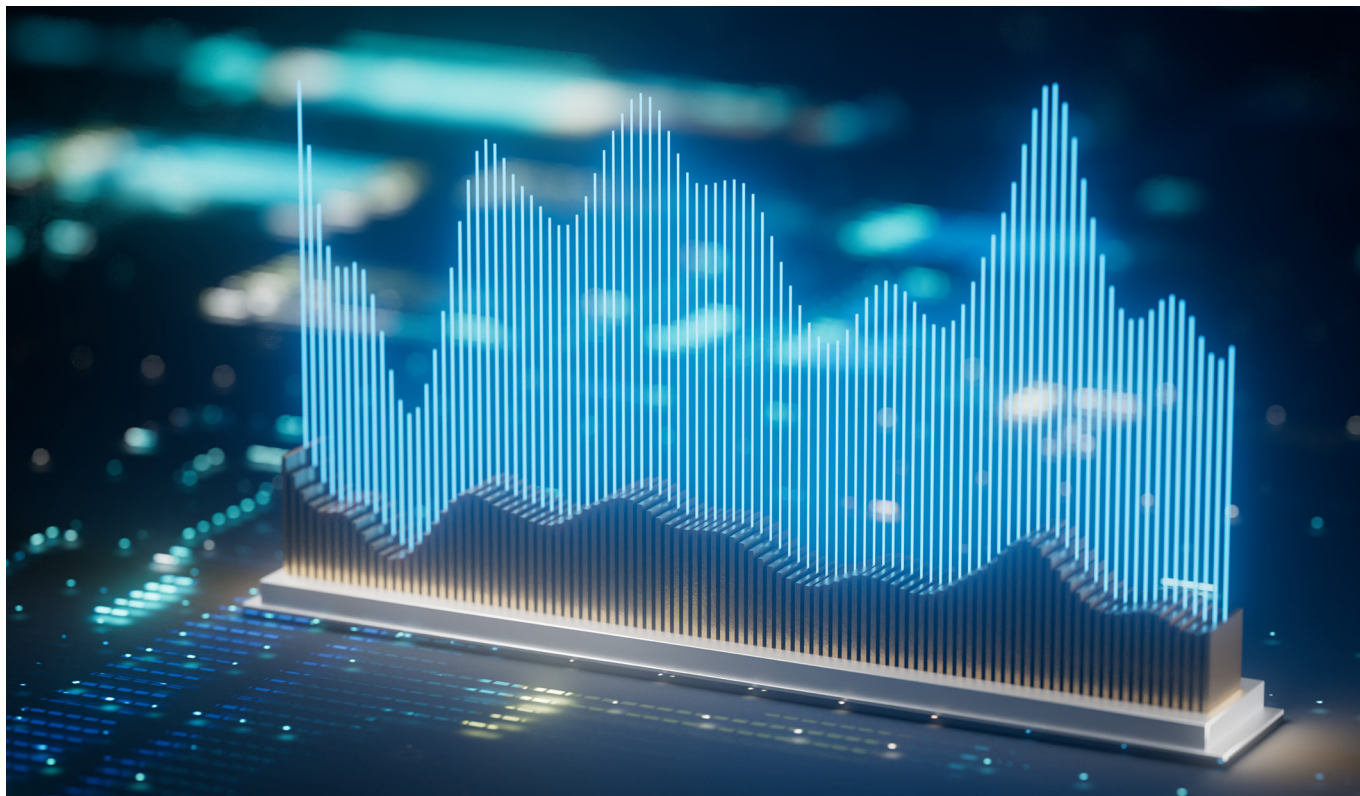

New positions are opened only when all relevant parameters are met. Spread limits, market volatility, trend filters and defined price intervals must all align. Only then can a position be established.

MANUAL NEWS MANAGEMENT

Trading is paused manually during significant economic events such as Fed meetings, the announcement of the US federal budget or the consumer price index. Existing positions remain in the market, but no new trades are placed until the market environment has stabilised. This approach protects the strategy from extreme price movements and excessive discrepancies between the target price and the actual execution price of an order.

PERFORMANCE EXPECTATION

CONTINUOUS PERFORMANCE

GROWTH RATHER THAN SPECULATION

The system does not aim for short-term doubling of capital, but rather for steady growth based on a clearly defined set of rules. Capital growth is determined by market conditions and the chosen risk profile, and can be viewed transparently at any time via external analysis platforms.

AVERAGE PERFORMANCE

Since live trading began in March 2022, the average net return – depending on market conditions and configuration – has been around 2.6% per month, subject to market volatility and risk settings.

CONTROLLED DRAWDOWN

The maximum negative intraday fluctuation recorded to date has been -15%. Such fluctuations may occur during daily trading activities. To date, positive results have always been achieved at the end of the month. Through time-controlled trading logic and manual news management, risk remains structured and transparent.

EXTERNAL ANALYSIS SINCE 2022

The strategy is evaluated with complete transparency via an independent platform and can be viewed on request.

**AVERAGE MONTHLY NET RETURN
SINCE MARCH 2022:**

+2.41%

ASSET COVERAGE AND RISK DIVERSIFICATION

FOCUS ON SPECIALISATION

FOCUS RATHER THAN WASTED COVERAGE

Instead of trading numerous currency pairs or asset classes simultaneously, the system focuses entirely on EUR/USD, one of the most liquid and heavily traded currency pairs in the world, when working with genuine brokers. This clear focus enables more precise market analysis, leaner decision-making processes and a high degree of reproducibility, without the waste caused by over-diversification.

ADVANTAGE OF SINGLE-ASSET SPECIALISATION

Compared to other volatile markets such as gold or GBP/JPY, the EUR/USD exhibits clearly structured market behaviour. Corrections, trend phases and consolidation zones occur in recurring patterns. This environment is ideally suited to systematic position management. This characteristic forms the basis of the entire strategy.

SCALABLE RISK ACROSS DEFINED TIMEFRAMES

Risk is not managed through the selection of different assets, but via the timeframe and the number of active algorithms. The shorter the timeframe, the higher the trading frequency and thus the potential return, but also the risk. This creates scalability.

TECHNICAL ANALYSIS RATHER THAN RANDOM DIVERSIFICATION

The system consistently focuses on analysing typical EUR-USD patterns, with an emphasis on overreactions, retracement zones and short-term inefficiencies. This methodical approach leads to controlled risk and more efficient use of capital.

VERIFIED TRADING BALANCE SHEETS

OBJECTIVE AND COMPREHENSIBLE

Since 2022, the strategy has been evaluated with full transparency via the external analysis platform 'myfxbook' and can be viewed in real time.

CAPITAL PERFORMANCE

All trades, key figures and performance curves are automatically recorded and can be independently tracked without the need for manual intervention or retrospective adjustments. External verification provides an objective insight into actual trading performance, including drawdown trends, profit factors, daily statistics and risk-adjusted results. Capital performance exhibits a consistently traceable structure that is influenced neither by short-term market sentiment nor by subjective decisions.

UNSERE PARTNER

We work with the MultiBank Group and PuPrime – established international providers in the online trading sector. You have the option of opening an account with one of our partners.

OVERALL STATISTICS

RETURNS

Period: Since March 2022

IMPORTANT

Yield presentation and calculation logic

The yield figures are based on **cumulative performance**, whereby all income automatically remains in the system.

This results in the reported **cumulative performance**, which determines the total and annual yields. This is similar to the compound interest effect when interest is reinvested.

Overall Performance

With just under four years of active trading, the system has achieved a cumulative* Net return of +269.68%. Based on real live data (no backtesting, no demo account).

CUMULATIVE* NET RETURN

+269.68%

This results in an average annual net return:

The average annual Net return is approximately +33.01%, depending on the market phase and risk profile. The calculation is based on real trading results, which have been consistently documented since the start.

AVERAGE ANNUAL NET RETURN

+33.01%

Average monthly net performance:

The average monthly Net return is around +2.41%. As this is a dynamic trading system, performance fluctuates. The target range is between +1.5% and +4% per month.

AVERAGE MONTHLY NET RETURN

+2.41%

Maximum drawdown (intraday fluctuation):

The highest drawdown to date was around -15%. This was a single intraday event and was not realised. Every day and every month has always closed with a positive ROI.

MAXIMUM DRAWDOWN (NOT REALIZED)

-15%

*Cumulative performance figures are geometric return calculations, which means that the returns remain in the investment, unlike in linear calculations. This is similar to the compound interest effect when interest is reinvested.
